The Consumer Prices Index (CPI) and the Retail Prices Index (RPI) measure the change in the price of a fixed basket of representative goods and services bought by consumers within the United Kingdom. This involves calculating an average of the price changes of the items in the 'basket'. As some items are more important than others in terms of their share of household expenditure an allocation of representative weights needs to be applied to the basket. The CPI and RPI are therefore both constructed by weighting together the price movements of items according to their relative importance to the overall expenditure level of households. At the beginning of each year the weights used to compile both the CPI and RPI are updated using the latest available information on household spending.

In March 2013, a new additional measure of Consumer Price Inflation called CPIH¹ was introduced which includes owner occupiers' housing costs (OOH). A separate set of weights (using the same source data and methodology as CPI) are calculated for CPIH which account for the new OOH component. Full details regarding CPIH and the weight of OOH can be found via the [attached article](#).

Following a research programme conducted by the Office for National Statistics (ONS) and a public consultation in late 2012, the National Statistician concluded that one of the formulae (known as the Carli) used to calculate the RPI does not meet international standards. Therefore an improved variant of the RPI called RPIJ² was published in March 2013, where the use of the Carli has been replaced by the use of the geometric mean (also known as the Jevons formula). This will aid current users of the RPI in understanding the impact of the Carli formula on the RPI inflation rate. RPIJ is currently designated by ONS as an experimental statistic and is being assessed for National Statistics status. The assessment is expected to be completed by the summer of 2013. The weights calculated and used in the RPIJ are exactly the same as for the RPI.

In developing her recommendations, the National Statistician also noted that there is significant value to users in maintaining the continuity of the existing RPI's long time series, without any major change, so that it may continue to be used for long-term indexation and for index-linked gilts and bonds in line with user expectations.

¹ <http://www.ons.gov.uk/ons/guide-method/user-guidance/prices/cpi-and-rpi/introducing-the-new-cpih-measure-of-consumer-price-inflation.pdf>

² <http://www.ons.gov.uk/ons/rel/cpi/introducing-the-new-rpij-measure-of-consumer-price-inflation/1997-to-2012/index.html>

In accordance with the Statistics and Registration Service Act 2007, the Retail Prices Index and its derivatives were assessed against the Code of Practice for Official Statistics and found not to meet the required standard for designation as National Statistics. A full report, published in March 2013, can be found on the [UK Statistics Authority](#) website. As mentioned above, the RPI will continue to be published by ONS as an official statistic.

The rest of this article provides:

- Brief details of the review of the 2013 CPI and RPI baskets (as this review coincides with the annual updating of the weights).
- Additional detail on why weights are used in the construction of the CPI and RPI.
- The rationale for the frequency of updating the weights.
- Details on the population coverage and the data sources used to compile the weights.
- Information on the structure of the weighting - including details of where non-generic methods are used to construct the weights and notable exclusions in the weighting framework.
- Details of the different weight types.
- A brief explanation of the main changes to the CPI and RPI weights between 2012 and 2013.

The weights that will be used to construct the CPI and RPI for 2013 can be found in the tables at the end of the article. There is also a table (W5) that provides details of the underlying expenditure data used to construct the RPI section and pensioner weights.

Changes to the CPI and RPI baskets

Each year ONS reviews the basket of goods and services and updates the weights used to aggregate price changes. This is done to ensure that the selection of products in the basket and their weights remain representative of the overall pattern of expenditure of households covered by the CPI and RPI.

The updating of the weights coincides with the annual review of the CPI and RPI basket of goods and services. The 2013 review of the CPI and RPI baskets is described in a separate article, 'Consumer Prices Index and Retail Prices Index: The 2013 Basket of Goods and Services', which is available on the [Office for National Statistics website](#).

Why weights are used in the construction of the CPI and RPI

Households spend more on some goods and services than others. We would therefore expect price increases for certain items to have a larger impact on the overall change in the cost of the 'basket' than others. The weights for both the CPI and RPI reflect these varying degrees of importance. By way of an example, let's say that on average, households spend about ten times as much on fruit as they do on postal services. A five per cent increase in the price of fruit would then have ten times as much effect on the total cost of the 'basket' when compared to a five per cent increase in postal charges. Each item in the index is weighted to reflect the proportion of household expenditure spent on the item.

Frequency of updating the weights

Both the CPI 'class weights', RPI 'section weights' and the item weights for both the CPI and RPI are updated every year to coincide with the general review of the representative items in the basket. Class and section weights represent fairly broad commodity groups such as 'bread' or 'footwear'; item weights reflect narrower groupings or types of products such as 'white sliced bread' or 'men's training shoes'.

Annual updates to the weights are necessary to ensure that the CPI and RPI remains representative of current household expenditure patterns. In addition, weights also need to be updated to reflect the introduction of new items and the removal of old ones.

Population coverage and data sources of the weights

Expenditure weights should reflect the expenditure patterns of the target population of households covered by the index. This differs between the CPI and RPI and as a consequence the expenditure weights also differ between the two indices.

Consumer Prices Index

The CPI covers all expenditure within the UK made by:

- private households;
- residents of institutional households such as University halls of residence or nursing homes;
- tourists.

Information on spending patterns, which underlie the CPI weights, largely comes from the household expenditure component of the UK National Accounts. This is in accordance with the Household Final Monetary Consumption Expenditure (HFMCE) concept as defined in the European System of Accounts 1995 (ESA 95). The weights shown in Table W1 will be used to compile the CPI for the period January 2013 to December 2013 inclusive.

Retail Prices Index

The expenditure underlying the RPI weights is more limited than that of the CPI. The RPI is based on the spending of private UK based households only and also excludes:

- the top 4 per cent of households by income;
- 'pensioner' households (where the head of the household is retired and economically inactive) and where at least three-quarters of the household income is derived from state benefits.

These households are excluded because they are considered to have 'atypical' spending patterns and therefore their inclusion would distort the overall average price movement of the RPI. Information on spending patterns underlying the RPI weights is predominately sourced from the Living Costs and Food Survey (LCF), which is part of ONS's Integrated Household Survey (IHS). The LCF is also one of the major inputs into the household expenditure component of the UK National Accounts. The weights shown in Table W2 will be used to compile the RPI for the period February 2013 to January 2014 inclusive.

Weighting structures

Consumer Prices Index

The CPI is classified according to COICOP (**C**lassification **O**f **I**ndividual **C**onsumption by **P**urpose). This is the international classification of household expenditure and is used by both the National Accounts and the LCF. For the 2013 weights, the information about spending patterns for most COICOP classes was obtained from the latest available data from the United Kingdom National Accounts (Blue Book 2012³) – this relates to the calendar year 2011. These data are updated to December 2012 using movements in the relevant COICOP class price indices.

For insurance, a 'net' concept is used in the construction of the weights. The expenditure used to calculate the weight for insurance relates only to the 'service charge' element of insurance premiums paid. The remainder of the premiums paid represent 'claims paid out'; this expenditure is redistributed to the appropriate COICOP classes. For example, expenditure on car repairs following an accident which is reimbursed by the insurance company is allocated to the 'maintenance and repairs of personal transport equipment' class. To avoid the possibility of 'negative' weights in years where claims expenditure exceeds premiums paid, a three year average of National Accounts data are used.

Expenditure by households on owner occupied housing costs was historically excluded from the CPI. A major reason for this related to the difficulties of measuring these costs in a comparable way internationally. However, expenditure by households on owner occupied housing costs was implemented in a new, additional measure of Consumer Price Inflation

³ <http://www.ons.gov.uk/ons/re1/naa1-rd/united-kingdom-national-accounts/the-blue-book--2012-edition/index.html>

called CPIH in March 2013. CPIH uses the same classification system and source data for weights as CPI, with the only exception being the inclusion of OOH. Full details on this new index and the methodology used can be found via the [CPIH](#) article ⁴ on the ONS website.

[Retail Prices Index](#)

RPI uses a bespoke classification system which has evolved over time following the recommendations of various RPI Advisory Committees. For the 2013 weights, the information about spending patterns for most sections was obtained from the latest available data from the LCF which covers the period July 2011 to June 2012, updated to January 2013 using movements in the relevant section price indices.

For the sections covering expenditure on furniture and repairs & maintenance charges, a three year average of LCF data are used because of the large sampling errors that can arise from a single year's data for these expenditure categories.

The LCF is a continuous household survey, which monitors the spending patterns of around 5,500 households (from an issued sample of approximately 11,500) across the country each year. From this survey the changing pattern of household spending can be monitored at regular intervals. Some sections are known to under-record the actual expenditure in this survey and are required to be adjusted. Appropriate adjustments are made to soft drinks, confectionery, alcoholic drink and tobacco products using the Household Final Consumption Expenditure (HHFCE) component of the National Accounts, which is derived from a variety of sources. In common with National Accounts, the weights used for alcohol and tobacco products include estimates of household expenditure on smuggled alcohol and tobacco.

Weights for the costs of owner-occupation, comprising mortgage interest payments and depreciation, are not based on LCF expenditure data. The weight for depreciation is calculated using National Accounts data to estimate a rate of depreciation for household sector dwellings, which is applied to the average house price, excluding land, to give a notional annual cost of depreciation. The weight for mortgage interest payments is based on a modelled mortgage incorporating both repayment and endowment components over an average 23 year term. Each of these is updated annually and expressed in terms of average weekly expenditure.

Given the price and under-recording adjustments that have been outlined, the estimation of owner-occupiers housing costs and the coverage of RPI index households, the average weekly expenditures given in Table W5 do not correspond to the estimates of average household weekly expenditure as estimated by the LCF and published by ONS in 'Family Spending'.

⁴ <http://www.ons.gov.uk/ons/rel/cpi/introducing-the-new-cpih-measure-of-consumer-price-inflation/2005-to-2012/index.html>

Weight Types

Class/Section and Item weights

Each item included within the index belongs to a CPI 'class' or an RPI 'section'. Classes and sections comprise of a group of similar or related goods or services items. They represent the lowest level of aggregation for which LCF and National Accounts expenditure weights can be reliably and consistently estimated. For example, expenditures on alcoholic beverages, such as lager and bitter are aggregated together to derive a reliable weight for the 'beer' class or 'beer off sales' section. In total there are 85 classes in the CPI (86 in CPIH due to the inclusion of OOH) and 85 sections in RPI/RPIJ for which weights are produced. Both class and section weights are calculated as parts per thousand.

As explained, each class or section consists of one or more similar items and each of these items is also given a weight, known as an item weight, which reflects relative expenditure on that item within the class or section. For example, in the RPI the bread section is composed of five bread items with white sliced loaf having the largest item weight. In terms of total expenditure this reflects the fact that this remains the most popular type of bread purchased in the UK. The LCF is the primary source of the item weights but a number of other sources are also used; these include a variety of market research data, national accounts data and other government sources. While adequate as inputs to the calculation of higher level price indices, the item weights are not generally considered to be of publishable quality in their own right.

Pensioner weights

Pensioners largely dependent on benefits tend to have different spending patterns when compared to the remainder of the population. Specific indices have been compiled for these households since 1968 (separately for one and two-person pensioner households). These specific indices differ from the 'general' CPI and RPI in being published quarterly rather than monthly. They exclude housing costs because of measurement problems due to a lack of reliable and relevant data, as well as certain other items such as canteen meals which have negligible expenditure levels. Due to the smaller LCF sample size, all pensioner weights are based on the last three years of available expenditure data (mid-2009 to mid-2012 for the 2013 weights) with all expenditures uprated to January 2013 prices. The very small sample sizes at 'section' level often gives rise to volatility of these weights between one year and the next. The separate weights calculated for these pensioner indices are shown in Tables W3 and W4.

Weight Changes 2012 to 2013

Changes in patterns of expenditure

Changes in the weights of components over time reflect the changing expenditure pattern of households. Tables W1 and W2 show the changes in weights for both the CPI (since 2001) and RPI (since 1997). The two sets of weights share common long-term trends in expenditure patterns, and are in general, broadly comparable. Due to the conceptual differences between the CPI and RPI, it is not straightforward to reconcile differences in weights between the two indices at a point in time, or to reconcile changes from one year and the next. These differences include population and commodity coverage, the different classification systems employed, and the differences in source data underlying both sets of weights.

Tables W1 and W2 show the changes in the CPI and RPI weights between 2012 and 2013. In interpreting these tables it should be noted that there are many reasons for weight changes between years apart from changes in expenditure resulting from changes in quantities bought or changes in actual or relative prices. These include, new and improved data sources, year on year sample variability of the underlying data sources, and changes in classification systems.

Consumer Prices Index

CPI Class weight movements 2012 to 2013

For the CPI, the following classes changed by +/- 4 parts per thousand (ppt) or more between 2012 and 2013.

1. **Gas** – down 6ppt from 32 to 26. This reflects a decrease in recorded household expenditure for gas during 2011 compared to 2010, which saw two exceptionally cold periods of weather in the UK.
2. **Fuels and lubricants for personal transport** – down 6ppt from 46 to 40. This change is due to prices increasing at a much quicker rate in 2011 (for last year's weights) compared to 2012. Given that price change is used to uprate underlying expenditure, the lower inflation for 2012 has caused the weight for this class to fall.
3. **Package holidays** – up 10ppt from 24 to 34: the increase is being driven, in the main, by the underlying household expenditure data underpinning the weights calculations and to a much lesser extent, increases in prices during the year.
4. **Other financial services** – up 7ppt from 23 to 30: this is due to an increase in household expenditure underpinning the weights calculations for 2013, specifically driven by the component for banking and finance.

[CPI Division weight movements 2012 to 2013](#)

Table 1 below summarises the weight changes in CPI at the division level.

Table 1: Summary of CPI division level weight movements – 2013

Division	2013 weight (parts per thousand)	2012 weight (parts per thousand)	Difference (parts per thousand)
01. Food and non-alcoholic beverages	106	112	-6
02. Alcoholic beverages and tobacco	44	42	2
03. Clothing and footwear	68	65	3
04. Housing, water, electricity and gas	137	144	-7
05. Furnishings and household equipment	59	61	-2
06. Health	25	24	1
07. Transport	148	162	-14
08. Communication	31	27	4
09. Recreation and culture	141	134	7
10. Education	21	19	2
11. Restaurants and hotels	117	114	3
12. Miscellaneous goods and services	103	96	7
Total	1000	1000	

Source: Office for National Statistics

At this higher level there are four divisions that warrant mention due to their weight change between 2012 and 2013.

[Division 04: Housing, water, electricity and gas](#)

This division has seen a weight decrease of 7ppt from 144 to 137. This movement is almost entirely due to the change in weight of the component class 'gas'. Full details regarding this change can be found in the above section of this article.

[Division 07: Transport](#)

This division has produced the largest point movement between 2012 and 2013 of -14ppt from 162 to 148. There are two component classes driving this decrease namely 'fuels and lubricants for personal transport' (the explanation for which is detailed above) and 'new cars'. The weight for new cars fell 3ppt between 2012 and 2013 and can be attributed to a fall in the underlying household expenditure on these items.

[Division 09: Recreation and culture](#)

This division has a weight increase of 7ppt from 134 to 141. The majority of this increase is caused by the component class *'package holidays'*, which is covered in more detail above. This increase for package holidays is offset by some smaller decreases in weight for other classes in this division (such as *'pets and related products/services'*).

[Division 12: Miscellaneous goods and services](#)

The weight for this division has increased from 96 in 2012 to 103 in 2013, a change of 7ppt. The movement in this division is driven by the class *'other financial services'*. An explanation for this change can be found in the above section.

[Retail Prices Index](#)

[RPI Section weights movements 2012 to 2013](#)

For the RPI, five sections have changed by +/-4 parts per thousand (ppt) or more between 2012 and 2013:

1. [Rent](#) – up 11ppt from 75 to 86. This change of 11ppt is due almost entirely to an increase in the level of average weekly expenditure underpinning the weights in 2013.
2. [Fees and subscriptions](#) - down 5ppt from 29 to 24. This is due solely to a decrease in the level of expenditure underpinning the weights calculations, which reverses the increase this section witnessed in 2012.
3. [Purchase of motor vehicles](#) – down 5ppt from 39 to 34. Once again, the change is due entirely to a decrease in the level of expenditure underpinning the weights in 2013 and follows the downward trend of the previous two years.
4. [Other travel costs](#) – down 5ppt from 13 to 8. This drop is caused by a general decrease in the recorded expenditure underpinning the weights across most of the items making up the section (principally *'passenger transport by air'* and *'boats'*).
5. [Wine and spirits on sales](#) – up 4ppt from 16 to 20. For certain goods and services covered by the LCF, an adjustment factor is required to account for known under-recording of expenditure. One such area is alcohol consumption. The adjustment ratio is calculated as the relationship between recorded expenditure for the good or service in household final monetary consumption expenditure (from the UK National Accounts) and the LCF. This adjustment ratio saw an increase of almost 20% compared with 2012, and is driving the increase in weight for this section.

[RPI Group weight movements 2012 to 2013](#)

Table 2 below summarises the weight changes in RPI at the Group level.

Table 2: Summary of RPI group weight movements – 2013

Group	2013 weight (parts per thousand)	2012 weight (parts per thousand)	Difference (parts per thousand)
Food	116	114	2
Catering	47	47	0
Alcoholic Drink	61	56	5
Tobacco	30	29	1
Housing	254	237	17
Fuel and Light	43	46	-3
Household Goods	60	62	-2
Household Services	62	67	-5
Clothing and Footwear	43	45	-2
Personal goods and Services	40	39	1
Motoring Expenditure	122	131	-9
Fares and Other Travel Goods	18	23	-5
Leisure Goods	30	33	-3
Leisure Services	74	71	3
Total	1000	1000	

Source: Office for National Statistics

At this higher level, there are five groups that warrant a mention.

1. [Alcoholic drink](#)

This group has a weight increase of 5ppt, from 56 to 61. This increase is attributed to an increase in the component section for 'wine and spirits on sales', which is explained in more detail above.

2. [Housing](#)

The weight for this group has increased by 17ppt from 237 to 254. This change is driven almost entirely by one of the eight sections in the group, 'rent' which has seen a weight increase of 11ppt. An explanation for this change can be found in the above section. There are other less significant weight increases for sections in this group.

3. Household services

This group has a weight decrease of 5ppt from 67 to 62. This change can be attributed to one section '*fees and subscriptions*', which is explained in more detail above.

4. Motoring expenditure

This group has a weight decrease of 9ppt from 131 to 122. The majority of this change can be attributed to one section '*purchase of motor vehicles*', which is explained in more detail above.

5. Fares and other travel goods

This group has a weight decrease of 5ppt from 23 to 18. This change can be attributed to one section '*other travel costs*', which is explained in more detail above.
